

SOC Alert Triage & Investigation Dashboard Using Splunk

- Developed a Splunk SIEM dashboard to investigate SSH brute-force attacks, suspicious web requests, persistence-related events, and automated reconnaissance activity within a simulated SOC environment.
- Created and optimized SPL queries to monitor authentication activity, detect suspicious HTTP requests, analyze threat severity, and correlate indicators of compromise across multiple log sources.
- Performed log analysis and incident triage using Splunk Enterprise, including failed authentication monitoring, successful login correlation, web enumeration analysis, and persistence detection using Sysmon and Linux logs.
- Documented investigation findings through dashboard visualizations, SOC-style reporting, and structured threat analysis to support cybersecurity monitoring and incident response workflows.
